**Note:**  
* DSC Stroke Performance Measure Set following harmonization of measure specifications with the Paul Coverdell National Acute Stroke Registry and American Heart Association / American Stroke Association GET WITH THE GUIDELINES™.  
** DSC certification for Primary Stroke Centers requires data collection for all 10 measures in the set.  

*** For *Antithrombotic Therapy By End of Hospital Day Two*, **STK-5 2008** is the measure from 2008, **STK-5** is an updated measure for 2009. For *Discharged on Cholesterol Reducing/Statin Medication*, **STK-6** is the Cholesterol Reducing Measure from 2008, **STK-6Statin** is the new Statin Measure for 2009.
The Joint Commission Stroke Performance Measurement Implementation Guide version 2a: Section 4

GENERAL POPULATION IDENTIFICATION
DISEASE SPECIFIC MEASURES - STROKE

The identification of patients/participants for inclusion in the performance measures related to stroke begins with a core set of data elements. These variables must be collected to determine eligibility for inclusion in any of the measure populations as well as case identification for analysis purposes. The first data elements listed are for administrative purposes in the dataset.

Case Identifier
Gender

The data elements listed next define the general pool of patients/participants who are eligible for consideration in each of the stroke measure populations. A flowchart follows that depicts the evaluation process for inclusion in the general population.

Diagnosis of Ischemic Stroke or Hemorrhagic Stroke (ICD-9-CM Principal Diagnosis Code)
Birth date (age 18 or older)
Treated at a Primary Stroke Center that is a certified Disease Specific Care (DSC) Program

This measure set is applicable to patients with diagnoses of ischemic stroke and hemorrhagic stroke. Each measure includes patients from one or both categories. The ICD-9-CM Principal Diagnosis Code that is used to identify the measure population is provided in tables found in the appendices (See Table 1 & Table 2). The following table identifies the population included in each measure:

Performance Measure Name: Deep Vein Thrombosis (DVT) Prophylaxis
Patients with an ischemic stroke or a hemorrhagic stroke and who are non-ambulatory should start receiving DVT prophylaxis by end of hospital day two.

Rationale:
Patients experiencing a stroke that involves a paretic or paralyzed lower extremity are at increased risk of developing deep vein thrombosis (DVT). One study noted proximal deep vein thrombosis in more than a third of patients with moderately severe stroke. Reported rates of occurrence vary depending on the type of screening used. Prevention of DVT, through the use of prophylactic strategies, in at risk patients is a noted recommendation in numerous clinical practice guidelines. Non-pharmacologic approaches include early mobilization and use of intermittent pneumatic compression stockings. Pharmacologic approaches involve early anticoagulant therapy including the administration of subcutaneous unfractionated heparin, low-molecular-weight (LMW) heparins and heparinoids if there are no contraindications. Aspirin alone is not recommended as an agent to prevent DVT.

Clinical Practice Guidelines Supporting Measure:
Duncan et al, Stroke Rehabilitation Clinical Practice Guidelines (Stroke. 2005;36:e100-e143.)
Post-Stroke Rehabilitation Guideline No.16, Agency for Healthcare Policy and Research (Now known as Agency for Healthcare Research and Quality), 1995

Type of Measure: Process
Improvement Noted As: An increase in rate
Numerator Statement: Non-ambulatory ischemic or hemorrhagic stroke patients who had DVT prophylaxis initiated by end of hospital day two.

Included Populations: Not applicable
Excluded Populations: None
Data Elements:
DVT Prophylaxis Initiated by End of Hospital Day 2
**Denominator Statement:** Ischemic or hemorrhagic stroke patients who are non-ambulatory at the end of hospital day 2.

**Included Populations:** *

Patients with a diagnosis of ischemic or hemorrhagic stroke. Refer to Appendices, Table 1 for ICD-9-CM principal diagnosis codes for ischemic and hemorrhagic stroke.

Patients with a diagnosis of hemorrhagic stroke. Refer to Appendices, Table 2 for ICD-9-CM principal diagnosis codes for hemorrhagic stroke.

Patients who are non-ambulatory by end of hospital day 2

* Refer to Get With The Guidelines & Coverdell specific processes for identifying populations for working rates

**Excluded Populations:**

Patients who are discharged prior to end of hospital day 2

Patients receiving comfort measures only by end of hospital day 2

Patients ambulating by end of hospital day 2

Patients admitted for the performance of elective carotid intervention

Patients less than 18 years of age

**Data Elements:**

**General data elements (applicable to all measures):**

- Admission Date
- Arrival Date
- Arrival Time
- Birthdate
- Case Identifier
- Comfort Measures Only
- Discharge Date
- Discharge Status
- Hispanic Ethnicity
- ICD-9-CM Principal Diagnosis Code
- Point of Origin for Admission or Visit
- Race
- Report Period
- Sex

**Clinical/measure specific data elements:**

- Patient Ambulatory at End of Hospital Day Two
- Admitted for Elective Carotid Intervention

**Risk Adjustment:** No

**Data Collection Approach:** Concurrent and retrospective data collection through administrative data/claims data, and medical record.

**Data Accuracy:**

**ICD-9-CM Codes:** Variation may exist in the assignment of ICD-9-CM codes; therefore, coding practices may require evaluation to ensure consistency.
Age Groups: > 18

DSC Measure Set: Stroke

Measure ID: DSC/Stroke-02

Performance Measure Name: Discharged on Antithrombotic Therapy
Patients with an ischemic stroke prescribed antithrombotic therapy at discharge

Rationale: The effectiveness of antithrombotic agents in reducing stroke mortality, stroke-related morbidity and recurrence rates has been studied in several large clinical trials. While the use of these agents for patients with acute ischemic stroke and transient ischemic attacks continues to be the subject of study, substantial evidence is available from completed studies. Data at this time suggest that antithrombotic therapy should be prescribed at discharge following acute ischemic stroke to reduce stroke mortality and morbidity as long as no contraindications exist. For patients with a stroke due to a cardioembolic source (e.g., atrial fibrillation, mechanical heart valve), warfarin is recommended unless contraindicated. Warfarin is not generally recommended for secondary stroke prevention in patients presumed to have a non-cardioembolic stroke.

Anticoagulants at doses to prevent deep vein thrombosis are insufficient antithrombotic therapy to prevent recurrent ischemic stroke or TIA.

Clinical Practice Guidelines Supporting Measure:

Type of Measure: Process

Improvement Noted As: An increase in rate

Numerator Statement: Number of patients prescribed antithrombotic therapy at hospital discharge
Included Populations: Not applicable

Excluded Populations: None

Data Elements:

Antithrombotic Therapy Prescribed at Discharge

Denominator Statement: Number of patients with ischemic stroke

Included Populations: *

Patients with a principal diagnosis of ischemic stroke. Refer to Appendix, Table 1 for appropriate ICD-9-CM principal diagnosis codes.

* Refer to Get With The Guidelines & Coverdell specific processes for identifying populations for working rates

Excluded Populations:

Patients discharged/transferred to another short term general hospital for inpatient care
Patients who expired
Patients who left against medical advice
Patients discharged to hospice (home or facility)
Patients receiving comfort measures only
Patients for whom discharge destination cannot be determined or unknown
Patients admitted for the performance of elective carotid intervention
Patients less than 18 years of age

STK-02: Discharged on Antithrombotic Therapy

Rate = \( \frac{E}{D + E} \)
Measure Information Form

DSC Measure Set: Stroke

Candidate Measure ID: DSC/Stroke-03

Performance Measure Name: Patients with Atrial Fibrillation/Flutter Receiving Anticoagulation Therapy
Patients with an ischemic stroke with atrial fibrillation/flutter discharged on anticoagulation therapy.

Rationale: Nonvalvular atrial fibrillation (NVAF) is a common arrhythmia and an important risk factor for stroke. It is one of several conditions and lifestyle factors that have been identified as risk factors for stroke. It has been estimated that over 2 million adults in the United States have NVAF. While the median age of patients with atrial fibrillation is 75 years, the incidence increases with advancing age. For example, The Framingham Heart Study noted a dramatic increase in stroke risk associated with atrial fibrillation with advancing age, from 1.5% for those 50 to 59 years of age to 23.5% for those 80 to 89 years of age. Furthermore, a prior stroke or transient ischemic attack (TIA) are among a limited number of predictors of high stroke risk within the population of patients with atrial fibrillation. Therefore, much emphasis has been placed on identifying methods for preventing recurrent ischemic stroke as well as preventing first stroke. Prevention strategies focus on the modifiable risk factors such as hypertension, smoking, and atrial fibrillation. Analysis of five placebo-controlled clinical trials investigating the efficacy of warfarin in the primary prevention of thromboembolic stroke, found the relative risk of thromboembolic stroke was reduced by 68% for atrial fibrillation patients treated with warfarin. The administration of anticoagulation therapy, unless there are contraindications, is an established effective strategy in preventing recurrent stroke in high stroke risk-atrial fibrillation patients with TIA or prior stroke.

STK-03: Patients With Atrial Fibrillation/Flutter Receiving Anticoagulation Therapy

*The JC definition for “Atrial Fibrillation” is:
The patient has a history of any atrial fibrillation (i.e., remote, persistent, or paroxysmal), or atrial flutter in the past or currently as documented in the medical record, OR atrial fibrillation/flutter or paroxysmal atrial fibrillation (PAF) is present during this admission as evidenced by EKG OR by “Other” ICD-9-CM code of 427.31 or 427.32

Rate = \frac{E}{D + E}
Measure Information Form

DSC Measure Set: Stroke

Candidate Measure ID: DSC/Stroke-04: Thrombolytic Therapy Administered

Performance Measure Name: Acute ischemic stroke patients who arrive at the hospital within 120 minutes (2 hours) of time last known well and for whom IV t-PA was initiated at this hospital within 180 minutes (3 hours) of time last known well.

Rationale: The administration of thrombolytic agents to carefully screened, eligible patients with acute ischemic stroke has been shown to be beneficial in several clinical trials. These included two positive randomized controlled trials in the United States; The National Institute of Neurological Disorders and Stroke (NINDS) Studies, Part I and Part II. Based on the results of these studies, the Food and Drug Administration approved the use of intravenous recombinant tissue plasminogen activator (IV r-TPA or t-PA) for the treatment of acute ischemic stroke when given within 3 hours of stroke symptom onset. A large meta-analysis controlling for factors associated with stroke outcome confirmed the benefit of IV tPA in patients treated within 3 hours of symptom onset. While controversy still exists among some specialists, the major society practice guidelines developed in the United States all recommend the use of IV t-PA for eligible patients. Physicians with experience and skill in stroke management and the interpretation of CT scans should supervise treatment.

Clinical Practice Guidelines Supporting Measure:

- Diagnosis and Initial Treatment of Ischemic Stroke, Institute for Clinical Systems Improvement (ICSI), 2001.
- Antithrombotic and Thrombolytic Therapy for Ischemic Stroke The Seventh ACCP Conference on Antithrombotic and Thrombolytic Therapy. Gregory W. Albers, MD, Chair; Pierre Amarenco, MD; J. Donald Easton, MD; Ralph L. Sacco, MD; and Philip Teal, MD (CHEST 2004; 126:483S–512S)

Type of Measure: Process

Improvement Noted As: An increase in rate
Numerator Statement: The number of patients for whom IV thrombolytic therapy was initiated at this hospital within 3 hours (≤ 180 minutes) of time last known well.

**Included Populations:** Not applicable

Measure Information Form

DSC Measure Set:  Stroke

Candidate Measure ID:  DSC/Stroke-06  (Measure from 2008)

Performance Measure Name:  Discharged on Cholesterol Reducing Medication

Ischemic stroke patients with LDL>100, or LDL not measured, or on cholesterol-reducer prior to admission, who are discharged on cholesterol reducing drugs.

Rationale:  An elevated serum lipid level has been a well-documented risk factor for coronary artery disease (CAD). Recently, there has been an increased focus on examining the relationship between elevated lipid levels and the incidence of stroke. In particular, some recent clinical trials have analyzed the association between lipids and non-hemorrhagic stroke. The reduction of LDL cholesterol, through lifestyle modification and drug therapy, for the prevention of strokes and other vascular events is recommended for patients with CAD in the National Cholesterol Education Program III (NCEPIII) Guidelines. In addition, recent evidence from the Stroke Prevention by Aggressive Reduction in Cholesterol Levels (SPARCL) trial supports the use of statins to lower LDL cholesterol in stroke patients without prior CAD and a fasting LDL > 100 mg/dL.

Based on these guidelines, all patients with ischemic stroke should have lipid profile measurement performed within 48 hours of admission unless outpatient results are available from within the past 30 days. Treatment for secondary prevention should be initiated in the presence of LDL> 100 mg/dL, or continued for patients who were previously on lipid-lowering therapy and have an LDL< 100 mg/dL.

Clinical Practice Guideline Supporting Measure:
• High-Dose Atorvastatin after Stroke or Transient Ischemic Attack. (New England Journal of Medicine. NEJM Vol. 355 2006:549-559,

Type of Measure:  Process

Improvement Noted As:  An increase in rate

Numerator Statement:  Patients who were prescribed cholesterol reducing therapy at hospital discharge

Included Populations:  Not applicable

Excluded Populations:  None

Data Elements:
Cholesterol reducing therapy prescribed at discharge

**Denominator Statement:** All Ischemic stroke patients with an LDL $\geq 100$ mg/dL OR who were on cholesterol reducing therapy prior to hospitalization OR LDL not measured

**Included Populations:** *
- Patients with a diagnosis of ischemic stroke. Refer to Appendices, Table 1 for ICD-9-CM principal diagnosis codes for ischemic stroke.
- Patients with LDL $\geq 100$ mg/dL
- Patients with LDL not measured
- Patients who were on cholesterol reducing therapy prior to hospitalization

* Refer to Get With The Guidelines & Coverdell specific processes for identifying populations for working rates

**Excluded Populations**
- Patients discharged/transferred to another short term general hospital for inpatient care
- Patients who expired
- Patients who left against medical advice
- Patients discharged to hospice
- Patients receiving comfort measures only
- Patients admitted for the performance of elective carotid endarterectomy

**Data Elements:**
All general data elements AND:
- Admitted for elective carotid endarterectomy
- Cholesterol reducing therapy prior to hospitalization
- LDL $\geq 100$ mg/dL

**Risk Adjustment:** No

**Data Collection Approach:** Concurrent and retrospective data collection through administrative data/claims data, and medical record.

STK-06: Discharged on Cholesterol Reducing Medication

Rate = E/(D + E)
Measure Information Form

DSC Measure Set: Stroke

Candidate Measure ID: DSC/Stroke-06  (Measure known as PSC Stroke-6Statin in Stroke PMT)

Performance Measure Name: Discharged on Statin Medication

Ischemic stroke patients with LDL > 100, or LDL not measured, or, who were on cholesterol reducing therapy prior to hospitalization are discharged on statin medication.

Rationale: An elevated serum lipid level has been a well-documented risk factor for coronary artery disease (CAD) and reflects an organ-specific manifestation of atherosclerosis which is a disease process that can affect the heart and the major and minor branches of the arterial tree. The reduction of LDL cholesterol, through lifestyle modification and drug therapy when appropriate, is recommended for the prevention of myocardial infarction and other major vascular events for patients with CAD (or coronary risk equivalent conditions) according to the National Cholesterol Education Program’s Adult Treatment Panel III (NCEP ATP III) Guidelines. Recently, there has been an increased focus on the detection of patients with these risk factors when they present with other manifestations of atherosclerosis, and assuring that these patients are treated with lipid lowering medication if they meet NCEP ATPIII guidelines. While symptomatic carotid artery disease is one of the recognized coronary disease risk equivalents that qualify patients for treatment under ATPIII, there was little data until recently about the role of lipid lowering to prevent recurrent stroke or major vascular events in patients who presented with atherosclerotic stroke but did not otherwise qualify for treatment under ATPIII. The Stroke Prevention by Aggressive Reduction in Cholesterol Levels (SPARCL) study examined the effects of statins to lower LDL cholesterol in patients with stroke or TIA of atherosclerotic origin who had no other reason for taking lipid lowering therapy (i.e., they were without prior CAD or risk equivalent conditions), and had a fasting LDL > 100 mg/dL. The trial convincingly demonstrated that intensive lipid lowering therapy using statin medication was associated with a dramatic reduction in the rate of recurrent ischemic stroke and major coronary events. The treatment was well tolerated and cost effective. As a result, intensive lipid lowering therapy through use of a statin medication is now recommended for all patients with stroke or TIA of atherosclerotic origin who have an LDL ≥ 100 mg/dL (or with LDL < 100 mg/dL due to being on lipid lowering therapy prior to admission).

Based on these guidelines, all patients with ischemic stroke or TIA should have lipid profile measurement performed within 48 hours of admission unless outpatient results are available from within the past 30 days. A large body of evidence suggests that non-fasting lipid levels drawn in the first 48 hours after a major vascular event are reliable predictors of baseline lipid profiles, but after that time they may become unreliable. It is recommended that all patients with ischemic stroke or TIA with coronary heart disease or symptomatic atherosclerotic disease who have an LDL ≥ 100 mg/dL (or with LDL < 100 mg/dL due to being on lipid lowering therapy prior to admission) should be treated with a statin. The target goal for cholesterol lowering is an LDL-C level of <100 mg/dL. An LDL-C <70 mg/dL is recommended for very high-risk persons with multiple risk factors. For patients with stroke of atherosclerotic origin, intensive lipid lowering therapy with statins should be initiated in those who have an LDL ≥ 100 mg/dL (or with LDL < 100 mg/dL due to being on lipid lowering therapy prior to admission).

Clinical Practice Guideline Supporting Measure:

**Type of Measure:** Process

**Improvement Noted As:** An increase in rate

**Numerator Statement:** Patients who were prescribed statin medication at hospital discharge

**Included Populations:** Not applicable

**Excluded Populations:** None

**Data Elements:**
*Statin medication prescribed at discharge*

**Denominator Statement:** All patients with an LDL ≥ 100 mg/dL, OR LDL not measured, OR who were on cholesterol reducing therapy prior to hospitalization

**Included Populations:** *

* Patients with a diagnosis of ischemic stroke. Refer to Appendices, Table 1 for ICD-9-CM principal diagnosis codes for ischemic stroke.
* Patients with LDL ≥ 100 mg/dL
* Patients with LDL not measured
* Patients who were on cholesterol reducing therapy prior to hospitalization. Refer to Appendices, Table 3 for a list of cholesterol-reducing medications.

* Refer to Get With The Guidelines & Coverdell specific processes for identifying populations for working rates

**Excluded Populations**

* Patients discharged/transferred to another short term general hospital for inpatient care
* Patients who expired
* Patients who left against medical advice
* Patients discharged to hospice (home or facility)
* Patients receiving comfort measures only
Patients for whom discharge destination cannot be determined or unknown
Patients admitted for the performance of elective carotid intervention
Patients less than 18 years of age
Patients with spontaneous LDL < 100 mg/dL
Patients without evidence of atherosclerosis

DSC Measure Set: Stroke

Candidate Measure ID: DSC/Stroke-07

Performance Measure Name: Dysphagia Screening
Patients with ischemic or hemorrhagic stroke who undergo evidence-based bedside testing protocol approved by the hospital before being given any food, fluids, or medication by mouth.

Rationale: Dysphagia is a potentially serious complication of stroke. The importance of assessing a patient’s ability to swallow, before approving the oral intake of fluids, food or medication, has been noted in multiple practice guidelines including the Agency for HealthResearch and Quality (AHRQ) Post-Stroke Rehabilitation guideline. It has been estimated that 27-50% of stroke patients develop dysphagia. Furthermore, 43-54% of stroke patients with dysphagia will experience aspiration and of those patients 37% will develop pneumonia. Dysphagia may contribute to malnutrition and increased length of hospital stay. Most guidelines include a recommendation that all patients be screened for their ability to swallow and those with abnormal results be referred for a complete examination by a speech and language pathologist or other qualified individual. Recent evidence suggests that pneumonia rates in this population may be reduced when a systematic program of diagnosis and treatment of dysphagia is included in an ischemic stroke management plan.

Clinical Practice Guideline Supporting Measure:
Post-Stroke Rehabilitation Guideline, Agency for Healthcare Research and Quality (formerly Agency for Health Care Policy and Research), 1995
Management of Patients with Stroke, Identification and Management of Dysphagia Scottish Intercollegiate Guideline Network, 1997
Duncan et al, Stroke Rehabilitation Clinical Practice Guidelines (Stroke. 2005;36:e100-e143.)
VA/DoD Clinical Practice Guideline for the Management of Stroke Rehabilitation in the Primary Care Setting, Department of Veteran Affairs Department of Defense, 2003

Type of Measure: Process

Improvement Noted As: An increase in rate

Numerator Statement: Patients who were screened for dysphagia before taking any food, fluids, or medications by mouth

Included Populations: Not applicable

Excluded Populations: None

Data Elements:
Dysphagia Screen

Denominator Statement: All patients with acute ischemic or hemorrhagic stroke

Included Populations: *
Patients with a diagnosis of ischemic stroke. Refer to Appendices, Table 1 for ICD-9-CM principal diagnosis codes for ischemic stroke.

Patients with a diagnosis of hemorrhagic stroke. Refer to Appendices, Table 2 for ICD-9-CM principal diagnosis codes for hemorrhagic stroke.

* Refer to Get With The Guidelines & Coverdell specific processes for identifying populations for working rates

Excluded Populations:

- Patients admitted for the performance of elective carotid intervention
- Patients less than 18 years of age
- Patients who are NPO throughout the hospital stay

Data Elements:

General data elements (applicable to all measures):

- Admission Date
- Arrival Date
- Arrival Time
- Birthdate
- Case Identifier
- Comfort Measures Only
- Discharge Date
- Discharge Status
- Hispanic Ethnicity
- ICD-9-CM Principal Diagnosis Code
- Point of Origin for Admission or Visit
- Race
- Report Period
- Sex

Measure specific data elements

- NPO throughout the hospital stay
- Admitted for Elective Carotid Intervention

Risk Adjustment: No

Data Collection Approach: Concurrent and retrospective data collection through administrative data/claims data, and medical record.

Data Accuracy:

ICD-9-CM Codes: Variation may exist in the assignment of ICD-9-CM codes; therefore, coding practices may require evaluation to ensure consistency.

Age Groups: Age ≥ 18

Data Reported As: Proportion

Setting: Primary Stroke Centers

Report Period: Quarterly with monthly data points
Selected References:
STK-07: Dysphagia Screening

Rate = \frac{E}{D + E}
Measure Information Form

DSC Measure Set: Stroke

Candidate Measure ID: DSC/Stroke-08

Performance Measure Name: Stroke Education
Patients with ischemic or hemorrhagic stroke or their caregivers who were given education and/or educational materials during the hospital stay addressing all of the following: personal risk factors for stroke, warning signs for stroke, activation of emergency medical system, need for follow-up after discharge, and medications prescribed at discharge.

Rationale: There are many examples of how patient education programs for specific chronic conditions have increased healthful behaviors, improved health status, and/or decreased health care costs of their participants. Clinical practice guidelines include recommendations for patient and family education during hospitalization as well as information about resources for social support services. Some clinical trials have shown measurable benefits in patient and caregiver outcomes with the application of education and support strategies. The type of stroke experienced and the resulting outcomes will play a large role in determining not only the course of treatment but also what education will be required. Patient education should include information about the event (e.g., cause, treatment, and risk factors), the role of various medications or strategies, as well as desirable lifestyle modifications to reduce risk or improve outcomes. Family/caregivers will also need guidance in planning effective and realistic care strategies appropriate to the patient’s prognosis and potential for rehabilitation.

Clinical Practice Guideline Supporting Measure:

Duncan et al, Stroke Rehabilitation Clinical Practice Guidelines (Stroke. 2005;36:e100-e143.)
Post Stroke Rehabilitation, Clinical Practice Guideline No.16, Agency for Health Care Policy and Research (now known as Agency for Healthcare Research and Quality), 1995

Type of Measure: Process

Improvement Noted As: An increase in rate

Numerator Statement: Stroke patients with documentation that they or their caregivers were given education and/or educational material addressing all of the following:

1. Personal risk factors for stroke
2. Warning signs for stroke
3. Activation of emergency medical system
4. Need for follow-up after discharge
5. Medications prescribed at discharge

Included Populations: Not applicable

Excluded Populations: None

Data Elements:
Education addresses need for follow-up after discharge
Education addresses medications prescribed at discharge
Education addresses risk factors for stroke
Education addresses warning signs and symptoms of stroke
Education addresses activation of emergency medical system

Please Note: The data elements for each of the 5 education components provide the opportunity to assess each component individually. However, completion of all 5 education categories is required for this composite measure.

Denominator Statement: Patients with ischemic stroke or hemorrhagic stroke

Included Populations:*

Patients with a diagnosis of ischemic stroke. Refer to Appendices, Table 1 for ICD-9-CM principal diagnosis codes for ischemic stroke.
Patients with a diagnosis of hemorrhagic stroke. Refer to Appendices, Table 2 for ICD-9-CM principal diagnosis codes for hemorrhagic stroke.

* Refer to Get With The Guidelines & Coverdell specific processes for identifying populations for working rates

Excluded Populations:

Patients discharged/transferred to another short term hospital for inpatient care
Patients who expired
Patients discharged against medical advice
Patients discharged to hospice (home or facility)
Patients receiving comfort measures only
Patients for whom discharge destination cannot be determined or unknown
Patients admitted for the performance of elective carotid intervention
Patients less than 18 years of age

Data Elements:
General data elements (applicable to all measures):

Admission Date
Arrival Date
Arrival Time
Birthdate
Case Identifier
Comfort Measures Only

DSC Measure Set: Stroke

Candidate Measure ID: DSC/Stroke-09

Smoking Cessation Performance Measure Name: Smoking Cessation/ Advice/Counseling

Patients with ischemic or hemorrhagic stroke with a history of smoking cigarettes, who are, or whose caregivers are, given smoking cessation advice or counseling during hospital stay. For the purposes of this measure, a smoker is defined as someone who has smoked cigarettes anytime during the year prior to hospital arrival.

Rationale: Cigarette smoking is the single most alterable risk factor contributing to premature morbidity and mortality, accounting for approximately 430,000 deaths in the United States. Smoking nearly doubles the risk of ischemic stroke. Numerous prospective investigations have demonstrated substantial decrease in coronary heart disease mortality for former smokers, and similar rapid decreases in risk with smoking are seen for ischemic stroke. The Framingham Heart Study concluded that smoking made a significant independent contribution to the risk of stroke. Although no randomized controlled trials have been performed, there is very strong consensus that patients who smoke should be counseled to stop smoking to decrease the risk of stroke. Research indicates that patients who receive even brief smoking cessation advice from their physicians are more likely to quit than those receiving no counseling at all. Addressing smoking habits and initiating cessation efforts are reasonable interventions during hospitalization for acute stroke and may promote the patient’s medical recovery.

Clinical Practice Guideline Supporting Measure:

- Management of Patients with Stroke. Rehabilitation, Prevention and Management of Complications and Discharge Planning, Scottish Intercollegiate Guidelines network, 2002

Type of Measure: Process

Improvement Noted As: An increase in rate.

Numerator Statement: Stroke patients (cigarette smokers) who receive smoking cessation advice or counseling during hospital stay, or documentation that patient’s caregiver was given smoking cessation advice or counseling during hospital stay.
Included Populations: Not applicable

Excluded Populations: None

Data Elements:

Adult Smoking Counseling

Denominator Statement: Ischemic stroke or hemorrhagic stroke patients with a history of smoking cigarettes anytime during the year prior to hospital arrival

Included Populations:*

Patients with a diagnosis of ischemic stroke. Refer to Appendices, Table 1 for ICD-9-CM principal diagnosis codes for ischemic stroke AND History of smoking cigarettes anytime during the year prior to arrival
Patients with a diagnosis of hemorrhagic stroke. Refer to Appendices, Table 2 ICD-9-CM for principal diagnosis codes for hemorrhagic stroke AND History of smoking cigarettes anytime during the year prior to arrival

* Refer to Get With The Guidelines & Coverdell specific processes for identifying populations for working rates

Excluded Populations:

Patients discharged/transferred to another short term hospital for inpatient care
Patients who expired
Patients discharged against medical advice
Patients discharged to hospice (home or facility)
Patients receiving comfort measures only
Patients for whom discharge destination cannot be determined or unknown
Patients admitted for the performance of elective carotid intervention
Patients less than 18 years of age

Measure Information Form

DSC Measure Set: Stroke

Candidate Measure ID: DSC/Stroke-10

Performance Measure Name: Assessed for Rehabilitation
Patients with an ischemic stroke or hemorrhagic stroke who were assessed for rehabilitation services.

Rationale: Each year about 700,000 people experience a new or recurrent stroke, which is the nation’s third leading cause of death. Approximately two thirds of these individuals survive and require rehabilitation. Stroke is a leading cause of serious, long-term disability in the United States, with about 4.4 million stroke survivors alive today. Forty percent of stroke patients are left with moderate functional impairment and 15 to 30 percent with severe disability. More than 60% of those who have experienced stroke, serious injury, or a disabling disease have never received rehabilitation. Stroke rehabilitation should begin as soon as the diagnosis of stroke is established and life-threatening problems are under control. Among the high priorities for stroke are to mobilize the patient and encourage resumption of self-care activities as soon as possible. A considerable body of evidence indicates better clinical outcomes when patients with stroke are treated in a setting that provides coordinated, multidisciplinary stroke-related evaluation and services. Effective rehabilitation interventions initiated early following stroke can enhance the recovery process and minimize functional disability. The primary goal of rehabilitation is to prevent complications, minimize impairments, and maximize function.

Measure Information Form

DSC Measure Set: Stroke

Candidate Measure ID: DSC/Stroke-05  (Measure known as PSC Stroke-5 2008 in Stroke PMT)

Performance Measure Name: Antithrombotic Therapy By End of Hospital Day Two

Patients with ischemic stroke who receive antithrombotic therapy by the end of hospital day two.

Rationale: The effectiveness of antithrombotic agents in reducing stroke mortality, stroke-related morbidity and recurrence rates has been studied in several large clinical trials. While the use of these agents for patients with acute ischemic stroke and transient ischemic attacks continues to be the subject of study, substantial evidence is available from completed studies. Data at this time suggest that antithrombotic therapy should be initiated within 48 hours of symptom onset in acute ischemic stroke patients to reduce stroke mortality and morbidity as long as no contraindications exist.

Anticoagulants at doses to prevent deep vein thrombosis are insufficient antithrombotic therapy to prevent recurrent ischemic stroke or TIA.

Clinical Practice Guidelines Supporting Measure:
- Guideline on the Use of Aspirin as Secondary Prophylaxis for Vascular Disease in Primary Care, Centre for Health Services Research University of Newcastle upon Tyne, & Centre for Health Economics of York, 1998

Type of Measure: Process

Improvement Noted As: An increase in rate

Numerator Statement: Patients with ischemic stroke who receive antithrombotic therapy by end of hospital day two

Included Populations: Not applicable
Excluded Populations: None

Data Elements:
- Antithrombotic Therapy Administered by End of Hospital Day Two

Denominator Statement: All patients with ischemic stroke

Included Populations: *
- Patients with a diagnosis of ischemic stroke. Refer to Appendices, Table 1 for ICD-9-CM principal diagnosis codes for ischemic stroke.

* Refer to Get With The Guidelines & Coverdell specific processes for identifying populations for working rates

Excluded Populations:
- Patients discharged before the end of hospital day 2

Data Elements:
General data elements (applicable to all measures):
